ATEX Warning Statements

GRINDERS

Due to the nature and design of grinding and macerating equipment it is possible that certain objects may enter the cutters, from the process stream, with the potential to cause sparking or jamming of the cutter assembly.

Where a grinder unit is to be installed in a potentially explosive atmosphere ensure that this has been specified at the time of purchase and that the equipment has been supplied accordingly and displays an ATEX nameplate or is supplied with a certificate of conformity. If there is any doubt as to the suitability of the equipment please contact Mono Pumps Limited before commencing with installation and commissioning.

Process liquids or fluids should be kept within specified temperature limits otherwise the surface of grinder or system components may become an ignition source due to temperature rises. Where the process liquid temperature is less than 90°C the maximum surface temperature will not exceed 90°C provided the grinder is installed, operated and maintained in accordance with this manual. Where the process fluid temperature exceeds 90°C the maximum surface temperature will be equal to the maximum process fluid temperature.

Cavities that could allow the accumulation of explosive gases, such as under guards, should where possible, be designed out of the system. Where this is not possible they should be fully purged before any work is carried out on the grinder or system.

Electrical installation and maintenance work should only be carried out by suitably qualified and competent persons and must be in accordance with relevant electrical regulations.

All electrical equipment, including control and safety devices, should be suitably rated for the environment in to which they are installed.

Where there may be a risk of an accumulation of explosive gases or dust non-sparking tools should be used for installation and maintenance.

To minimise the risk of sparking or temperature rises due to mechanical or electrical overload the following control and safety devices should be fitted. A control system that will shut the grinder down if the motor current or temperature exceed specified limits or a jam of the cutter stack occurs. This may include a system that reverses the machine in order to clear any such jam. An isolator switch that will disconnect all electrical supply to the motor and ancillary electrical equipment and be capable of being locked in the off position. All control and safety devices should be fitted, operated and maintained in accordance with the manufacturer's instructions.

It is important that the grinder rotates in the correct direction to give an efficient grinding operation. This must be checked on installation and commissioning and after any maintenance has been carried out. Failure to observe this may lead to mechanical or electrical overload.

When fitting drives, couplings, and guards to a grinder unit it is essential that these are correctly fitted, aligned and adjusted in accordance with the O&M instructions. Failure to do so may result in sparking due to unintended mechanical contact or temperature rises due to mechanical or electrical overload.

Mechanical seals should be suitably rated for the environment. The seal and any associated equipment, such as a flushing system, must be installed, operated and maintained in accordance with the manufacturer's instructions.

ATEX Warning Statements

Where a packed gland seal is fitted this must be correctly fitted and adjusted. This type of seal relies on the process liquid to cool the shaft and packing rings so a constant drip of liquid from the gland section is required. Where this is undesirable an alternative seal type should be fitted.

Failure to operate or maintain the grinder and ancillary equipment in line with the manufacturer's instructions may lead to premature and potentially dangerous failure of components. Regular inspection, and where necessary replacement, of bearings, seals, other wearing parts and lubrication is essential.

The grinder and its components have been designed to ensure safe operation within the guidelines covered by legislation. Accordingly Mono Pumps Limited have declared the machine safe to use for the duty specified as defined by the Declaration of Incorporation or Conformity that is issued with this instruction manual. The use of replacement parts that are not manufactured by or approved by Mono Pumps Limited may affect the safe operation of the grinder and it may therefore become a safety hazard to both operators and other equipment. In these circumstances the Declaration provided will become invalid. The guarantee referenced on the Terms and Conditions of Sale will also be invalidated.

Introduction

This information and all the information contained herein, is the exclusive property of Mono Pumps Ltd, and contains information of a proprietary nature. It is provided for the sole purpose of transmitting the information contained to the designated recipient.

This information is to be used only as specified in the instrument of transmittal. It is not to be reproduced, copied in whole, or in part, nor is information it contains to be disclosed in any manner without the written consent of Mono Pumps Ltd. Its use for any other reason than the specified shall be a violation of the agreement with the recipient concerning the legal rights of Mono Pumps Ltd.

Mono Pumps Ltd reserves the right to make changes, which may obsolete certain parts of this manual.

The manual gives a guide to the operation and maintenance of the Macerator given that all Health and Safety and good engineering practices are observed.

The information below is for contract No. _____
supplied.

MADE IN GREAT BRITAIN	MONO PUMPS LTD

EC Declaration as defined by Machinery Directive 2006/42/EC.

The following harmonised standards are applicable: BS EN 809, BS EN ISO 12100 Parts 1 & 2

EC Declaration of Incorporation

This declaration is only valid when partly completed machinery has been supplied.

In this case, the machinery meets the requirements of the said directive and is intended for incorporation into other machinery or for assembly with other machinery in order to constitute relevant machinery as defined by the said directive including any amendments, which are valid at the time of supply.

IMPORTANT

This machinery must not be put into service until the relevant machinery into which it is to be incorporated has been declared in conformity to the said directive.

This declaration is only valid when the machinery has been installed, operated and maintained in accordance with these instructions and safety guidelines contained within as well as instructions supplied for equipment assembled with or intended for use with this equipment.

EC Declaration of Conformity

This declaration is not valid for partly completed machinery has been supplied.

In this case the machinery meets the requirements of the said directive including any amendments which are valid at the time of supply.

We further declare that, where applicable, said machinery also meets the requirements of:

The EMC Directive 2004/108/EC
The Low Voltage Directive 2006 /95/E
The Pressure Equipment Directive 97/23/EC
The Outdoor Noise Directive 2005/88/EC
The Drinking Water Directive 99/83/EC

IMPORTANT

This declaration is only valid when the machinery has been installed, operated and maintained in accordance with these instructions and safety guidelines contained within as well as instructions supplied for equipment assembled with or intended for use with this equipment.

**Mr C. Q. Griffiths - Engineering Services Manager.
for Mono Pumps Limited, Martin Street, Audenshaw,
Manchester England, M34 5JA**

Installation, Operation & Maintenance Instructions

1.0 TYPICAL CONSTRUCTION SPECIFICATIONS

Body:

Cast Iron to BS 1452 grade 220/260

Impeller:

Carbon chromium steel, hardened and tempered.

Cutting Ring:

Carbon chromium tool steel hardened.

Mechanical Seals:

Oil lubricated mechanical seal carbon/ceramic mounted external to process liquid.

Finish:

Standard paint finish is 1 coat primer and 1 coat hammer finish enamel gloss, to provide long term effective surface protection from the environment.

1.1 NOISE LEVEL

The Airborne noise emission of the Macerator does not exceed 70 dB(A).

2.0 OPERATING PRINCIPLES

Designed to operate in the waste water industry the Macerator is a rotating cutter/impeller type grinder operating within a stationary cutter ring. The impeller is of the tri-hammer design with tapped bosses for easy removal. The motor bearings are protected from the ingress of the process liquid by means of an oil lubricated mechanical seal located outside the process fluid.

3.0 INSTALLATION & OPERATION

3.1 INSTALLATION & SAFETY RECOMMENDATIONS

In common with other items of process plant, a Macerator must be correctly installed to ensure satisfactory and safe operation. The Macerator must also be maintained to a suitable standard.

Following these recommendations will ensure that the safety of personnel and satisfactory operation of the Macerator is achieved.

3.2 SYSTEM DESIGN & INSTALLATION

At the system design stage, consideration must be given to the provision of filler/drain plugs and adequate maintenance space. Where Macerators are installed horizontally, they should be mounted on a flat surface and bolted down, ensuring a firm fixing to reduce noise and vibration.

3.3 ELECTRICAL CONNECTIONS

Electrical connections should only be made using equipment suitable for both ratings and environment. Where any doubt exists regarding the suitability of equipment Mono Pumps Limited should be consulted before proceeding. All electrical work must be carried out in accordance with any local and IEE Regulations by suitably qualified personnel.

3.4 GENERAL SAFETY REQUIREMENTS

When handling harmful or objectionable materials, such as raw sewage, suitably rated motors should be specified for the environment concerned, together with the provision of ventilation adequate to disperse dangerous concentrations of vapours. It is recommended that, wherever possible, Macerators should be installed with provision for adequate lighting, thus ensuring that effective maintenance can be carried out in satisfactory conditions. A hosing down facility with adequate drainage is also recommended to simplify maintenance and prolong component life. Care must be taken when hosing down to protect electrical equipment from splashing and ingress of water. May contain substances from the ECHA SVHC Candidates List (REACH - Regulation (EC) No. 1907/2006)

3.5 EXPLOSIVE ATMOSPHERE

When installed in a potentially explosive atmosphere always ensure it complies with all Local Health and Safety and Factories Act requirements.

3.6 SYSTEM START-UP

All nuts, bolts, securing flanges and base mounting fixtures must be checked for tightness before operation. Ensure oil is present in the mechanical seal oil bath (level should be halfway up the sight glass). When commissioning the plant, all joints in the system must be checked thoroughly for leakage. If, when starting, the Macerator does not appear to operate correctly, the plant must be shut down immediately and the cause of the malfunction established before operations are recommenced.

WHERE MONO PUMPS LIMITED HAS SUPPLIED A MACERATOR UNIT ONLY, THE RESPONSIBILITY IS ON THE PURCHASER TO ENSURE INSTALLATION IS IN COMPLIANCE WITH THE RECOMMENDATIONS OF THE LOCAL HEALTH & SAFETY REGULATIONS APPLICABLE.

Installation, Operation & Maintenance Instructions

4.0 LUBRICATION SCHEDULE

See routine maintenance 5.1

5.0 MAINTENANCE (125mm UNIT AND 180mm UNIT)

5.1 ROUTINE MAINTENANCE

The use of a self-adjusting mechanical seal and few moving parts result in little routine maintenance for the Mono Pumps Limited Macerators; however, certain preventative measures may be taken: Periodically check oil level in the mechanical seal oil bath. Oil level should be halfway up sight glass. Top up if necessary using Shell Talpa 30 oil or equivalent. Substantial or rapid oil loss may be due to a defective or worn mechanical seal or lipseal.

Dismantle, inspect and replace as necessary. Periodically check cutter ring and impeller for signs of excessive wear. Replace as necessary to reduce absorbed power and possibility of clogging.

NOTE: It is recommended that the castings and pipework are inspected periodically when used with abrasive/corrosive mediums.

6.0 DISMANTLING PROCEDURE (125mm UNIT AND 180mm UNIT)

WARNING: ENSURE ELECTRICAL SUPPLY IS ISOLATED AND PADLOCKED BEFORE DISMANTLING THE UNIT.

INLET TRANSITION

- (1) Disconnect the inlet casing (20) by removing the bolts and washers (14, 15, 16) and the 'O' ring seal (5).

CUTTER RING

- (1) The cutter ring (2) can be eased out of the Macerator body (1) using a lever. Take care not to damage the 'O' ring seal (3) during removal.
- (2) Remove the locknut washers (7, 8, 9). N.B. Locknut is right hand thread.
- (3) Remove the impeller (4) from the shaft complete with brass washer (6). A special tool can be purchased from Mono Pumps Limited to ease this operation.

MECHANICAL SEAL

- (1) Remove oil bath drain plug (28) and drain oil.

- (2) Remove retaining boss (11) and gasket (12). N.B. Right hand thread. Take care not to damage the gasket. A special tool can be purchased from Mono Pumps Limited to ease this operation.

- (3) Remove mechanical seal rotating parts (13) complete with pressure spring from shaft seal sleeve (19).

- (4) The static seat can be removed from the retaining boss bore for inspection.

REAR OIL SEAL & SEAL SLEEVE

- (1) Remove motor to body retaining hardware (22, 23, 24, 25)

- (2) Carefully extract the Macerator body (1), taking care not to damage the shaft.

- (3) The lipseal (17) can now be pressed from its housing.

- (4) The shaft seal sleeve (19) can be removed by slackening off the grub screw (27) and sliding off the motor shaft.

7.0 ASSEMBLY PROCEDURE (125mm UNIT AND 180mm UNIT)

- (1) Ensure seal ring (26) is fitted.

- (2) Press on shaft seal sleeve (19) and lock in position using grub screw (27). Fit thrower (18) onto large diameter of sleeve.

- (3) Ensure keys (30) are in position on motor shaft.

- (4) Press lipseal (17) into housing bore in body (1).

- (5) Carefully fit the body (1) onto the motor flange, ensure no damage occurs to the lipseal (17) and secure using hardware (22, 23, 24, 25).

- (6) Fit the rotating element of the mechanical seal to the shaft sleeve and, ensuring that the recess in the static race lines up with the pin within the retaining boss, fit the retaining boss (11) and gasket (12) using a sealant/adhesive compound such as STAG. (A) on the retaining boss thread.

- (7) Fit the impeller (4) and retaining hardware (6, 7, 8, 9, 10) to the shaft end. The locknut (9) should be tightened to a torque of 52Nm.

- (8) Fit the seal ring (3) onto the cutter ring (2) and carefully press home into the main casting (1).

Installation, Operation & Maintenance Instructions

- (9) Fit the inlet casting (20) and seal ring (5), using retaining hardware (14, 15, 16).
- (10) Ensure oil drain plug (28) is tightened, and fill bath with Shell Talpa 30 oil or equivalent so that oil level is half way up the sight glass (29).
- (11) Fit filler plug (28) and check all bolt tightenings prior to operation.
